1. A washing machine control method comprising steps of:

determining a first water level by sensing a first laundry amount upon initiating a washing step;

determining a first wash pattern by sensing a second wet laundry amount;

comparing the sensed first and second laundry amounts to determine a first differential; and

resetting the determined water level and wash pattern by sensing a third laundry amount, if the first differential is greater than a first predetermined value.

- 2. The method as claimed in claim 1, further comprising a step of supplying water to a tub according to the first water level, wherein the sensed first laundry amount is a dry amount and the sensed second and third laundry amounts are wet amounts.
- 3. The method as claimed in claim 1, further comprising a step of performing the washing step according to the first water level and the first wash pattern, if the first differential is not greater than the first predetermined value.
- 4. The method as claimed in claim 1, the resetting step comprising steps of:

 comparing consecutively sensed laundry amounts to determine a second differential;

 re-sensing the third laundry amount, if the second differential is greater than a second predetermined value;
- setting a second water level and a second wash pattern based on a current value of the

- 6 re-sensed third laundry amount, if the second differential is not greater than the second
- 7 predetermined value; and
- performing the washing step according to the second water level and the second wash
- 9 pattern.
- 5. The method as claimed in claim 4, further comprising a step of displaying an
- error message if said re-sensing step is repeated a predetermined number of times.
